

## GALAXY "SPEAKER CONSOLE"

The "SPEAKER CONSOLE" is housed in a cabinet matching the GALAXY line of transceivers, such as the III or the V, and generally matching in appearance and size. It contains a quality PM type speaker, with a nominal impedance of 4 Ohms. It may be used with GALAXY'S transceivers, or any equipment calling for a PM type speaker of 3 to 8 Ohms. This unit is supplied with a connecting cable terminated in a phono type plug that connects directly to the audio output jack on GALAXY'S transceivers.

The "SPEAKER CONSOLE" has ample room inside behind the speaker to house the AC supply for the transceivers, minimizing desk-space required. Install the AC supply in the "SPEAKER CONSOLE" cabinet with the power cables for connection to the equipment facing the rear of the speaker case.

On receipt, the speaker should be checked for signs of obvious or hidden damage. The units were carefully packed when delivered to the carrier and any malfunction or physical damage must be attributed to damage enroute. If any damage is found, proper claims should be instituted with the carrier.

Correspondence relating to this item should be addressed:
